Sales Data Warehouse

Six raw files into one SQL Server star schema

THE PROBLEM

Sales, customer and product data sat in two systems, a CRM and an ERP, as six raw files.

WHAT I BUILT

A SQL Server warehouse in three layers (bronze, silver, gold) with a star schema and checks after every layer.

THE RESULT

60,398 sales rows in one star schema; every check after every layer comes back clean.

96.5%
of sales come from bikes, though bikes are a quarter of the items sold

79%
of customers are new: under 12 months of history

0
rows back from every check that must come back empty

60,398
sales lines in the fact table, each with its customer and product

TOOLS

SQL Server · T-SQL · SSMS · draw.io
